Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 38914; 3071pp + Sequence Listing; English.

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM9191. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to polynucleotides may be used to production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting

```
the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK6763 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                          Query Match 3.9%; Score 28; DB 22; Length 1086; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                  sorting. Those cells demonstrated an average of six additional doublings in suspension culture and erythroid colony formation in methylcellulose. Suppression subtractive hybridization was used to construct the ad library (tester-sorted CD71+++ cells, driver-unsorted cells cultured without erythropoietin)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Clone distribution: MGC clone distribution information can be foun through the I.M.A.G.E. Consortium/LINL at: http://image.llnl.gov Series: IRAL Plate: 37 Row: j Column: 5
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 4885172
This clone has the following problem: frame shifted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://www.jax.org/nesources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymeracecide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative aganose gel electrophoresis. Vector DNA was prepared from a derivative of pmost (gil4732114glbAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicilin resistance. Introduce Res. 10 (12), 1996-2005 (2000)

Typanosoma cruzi.

Eukaryota; Euglenozoa; Kinetoplastida; Trypanosomatidae;
Trypanosoma; Schizotrypanum.

I (bases 1 to 388)
Aguero.F., Verdun,R., Frasch,A.C.C. and Sanchez,D.O.
A random sequencing approach for the analysis of the trypanosoma cruzi genome: general structure, large gene and repetitive DNA families, and gene discovery

Accounted Res. 10 (12), 1996-2005 (2000)

Discharge 2056489
On Sep 14, 2000 this sequence version replaced gi:9370392.

with a modified polylinker; Plasanid DNA from the
normalized library NCI_CGAP_PT22 was prepared, and
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The diver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
Subtraction by Bento Soares and 1217928-1220615).

Lennon and Soares, Genome Research 6: 791-806, 1996)
                                                                                                                                                                                                                                                   The sequence contained an oligo-dr track that was present in the oligoucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Notl site and the oligo-dr track served to verify it as a clone from the normalized uterus library cDNA Library Preparation: M.B. Soares Lab , University of Iowa EST sequencing: M.B. Soares Lab , University of Iowa EST sequencing: M.B. Soares Lab , Lowa Clone distribution: clones will be available through Research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        БН417627 544 bp DNA linear GSS 03-DEC-2001 CH230-159G24.TJ CHORI-230 Segment 1 Rattus norvegicus genomic clone CH230-159G24, DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 (bases 1 to 544)

Submitted (07-DEC-2001) DOE Joint Genome Institute, 2800 Mitchell Dirive, Walnut Creek, C8 94598, USA

On Dec 7, 2001 this sequence version replaced gi:15290448.

Draft Sequence Produced by DOE Joint Genome Institute
www.jgi.doe.gov
Finishing Completed at Stanford Human Genome Center
www-sigc.stanford.edu
Quality: Phrap Quality >=40 100% of Sequence;
Estimated Total Number of Errors is 0.

NOTE: This insert is not the entire sequence of the clone (entire sequence is 146.7kb). It is clipped at the overlap with AC012624.

The number of bases overlapped is 90404.

* NOTE: This is a 'working draft' sequence: It currently
* consists of 33 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                    AC091946 193446 bp DNA linear HTG 09-JUN-2001 Homo sapiens chromosome 5 clone RP11-36012, *** SEQUENCING IN PROGRESS ***, 33 unordered pieces.

Quality coverage: 5.55 in Q20 bases; sum-of-contigs estimation.
* NOTE: This is a Notking draft' sequence. It currently
* consists of 47 contigs. The true order of the pieces
* is not known and their order in this sequence ecord is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved

                                                                                                                                                                                                                                                                                                   The chicken CHD-W gene (AAT42754) acting alone or in conjunction with the closely related CHD-1A gene (AAT42751) is suggested to initiate female development in birds. The sequence of CDH-W was deduced from 2 clones isolated from a 10-day chick embryo library using a fragment of the CHD-1A gene as a probe. The CHD-W gene is located on the W chromosome. Probes based on CHD-W and CHD-1A give a W chromosome-specific signal on hybridisation to genomic DNA of a non-rarite bird and can be used for sex determin. of a bird. CHD-W nucleic acids can also be used to control the sex of progeny of a

The chicken CHD-W gene (AAT42754) acting alone or in conjunction with the closely related CHD-1A gene (AAT47751) is suggested to initiate female development in birds. The sequence of CDH-1A was deduced from 3 clones isolated from a stage 10-12 chicken embryo CDNA library using a great tit CHD-W sequence (see also AAT42755) as probe. The CHD-1A (A - Avian) gene shows close identity to the mouse CHD-1 gene (see also AAT42756-57). It is located on an autosome or 2 chromosome. Probes based on CHD-W and CHD-1A give a W chromosome specific signal on hybridisation to genomic DNA of a non-rantite bird and can be used for sax determin. Of a bird. CHD-1A nucleic acids can also be used to control the sex of the progeny of a bird.

Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.
                                                                                                                                                                                                                                                                                                                                                                                                                         seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA1997.DAT:AAT42757
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a bases 52-81 are a repeat of bases 22-51 and are ignored in the translated amino acid sequence given in Fig 3"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Avian chromodomain-helicase-DNA binding genes determine sex in birds – used for sex determn. and to control sex of progeny

                                          Bases 3855-3977 (AAT42756) of the mouse CHD-1 gene show homology to portions of the chicken CHD-1A (A - Avian) gene (AAT42757), chicken CHD-W (W refers to the W chromosome) gene (AAT4758) and and the great tit CHD-W gene (AAT42759). Translated amino acid sequences of this region are provided in AAW08146-49. The CHD-1A (see also AAT42751) and CHD-W (see also AAT42754-55) genes determine sex in birds and can be used to identify the sex of an embryo, foetus etc. and to manipulate the sex of progeny.

    The altered vertebrate telomere repeat binding protein (A-TRF) has a telomere repeat binding factor (TRF) dimerisation domain, and forms a hetero-dimer with TRP, preventing it from binding to the specified repeat sequence. A-TRF, optionally expressed by gene therapy, is used to inhibit shortening of telomeres associated with ageing (for cosmetic purposes) and disease, e.g. ataxia telahapeictasia. Down's syndrome, atrophy of the skin, age-related macular degeneration, atherosclerosis, tumours and viral (including human immune deficiency virus) infection. Cells expression of recombinant proteins or where intended for subsequent transplant or for testing, eliminating the need for transformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; digestive system antigen; gene therapy; cancer; appendicitis; ulcertive colitis; infection; Hirschsprung's disease, chronic colitis; digestive system disorder; Meckel's diverticulum; ss.
                                                                                         Nucleic acid encoding altered telomere repeat binding protein and related vectors - transformants, hetero-dimers and antibodies, used to inhibit shortening of telomerases caused by ageing or disease, also used to extend life of cells in culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       seq_name: /SIDS1/gcgdata/hold-geneseq/genesegn-embl/NA2001A.DAT:AAK88882

number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a cDNA encoding a digestive system antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; colorectal cancer; colorectal cancer antigen; gene therapy; ss.

The present invention provides the protein and coding sequences of a mumber of colorectal cancer antigens. These are shown in AAL57547-AAL57619 and AAM38569-AAM38641. These can be used in the diagnosis, prevention and treatment of cancer of the colon and/or rectum. The present sequence is a colorectal cancer antigen coding sequence of the invention.
 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the colon and rectum including colorectal cancers and also for testing and detection e.g. diagnosis ^{\circ}

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to polypeptides comprising an immunogenic part of a Leishmania and right associated DNA sequences, epitopes and fusion proteins are used in the production of compositions used for inducing a protective immune response against leishmaniasis, for prevention and treatment of the disease. The compositions can also be used generally to treat diseases that respond interleukin-15 stimulation. In addition, the products may contain an immunostimulant. The sequences represent companion and post primers used to amplify DNA of the invention.

The specification describes a method for the preparation of a collection of nucleic acids from organisms in a soil sample. The method comprises milling a dried sample to produce microparticles; suspending these in liquid buffer; extraction of nucleic acids from the microparticle; passing nucleic acid-containing solution through a microparticle; passing nucleic acid-containing solution through a microparticle; passing nucleic acid-enriched fractions through an anion exchange chromatography material; and recovering fractions containing purified nucleic acids. The nucleic acids are sources for sequences that encode either operons involved in a metabolic pathway (specifically polyketide synthesis) or polypeptides, particularly for production of therapeutic or agricultural compounds, especially polyketide antibiotics. ARP90034-39 represent open reading frames (ORFS) of the coding strand of cosmid
